Needs Assessment (NA)

- The tasks here focus on identifying and articulating the purpose and goals of the project, as well as identifying and understanding the project stakeholders. Activities contribute to the development of the business case, and subsequent charter for the project. Even if a project manager is not yet assigned, they should review this information to determine that the purpose, goals, and objectives are clear prior to proceeding with planning

Business Analysis Planning

- This domain focuses both on the deliverables and activities led by the business analyst as well as the processes used by the project team to support the business analysis work. This includes planning for requirements elicitation, management, and approval, as well as communications and version control.

Elicitation and Analysis (E/A)

- This domain should be your highest priority in learning the tasks and supporting tools and techniques since it will have the largest impact on your overall test score. Tasks range from elicitation, analysis, decomposition, approval, specification, and validation of requirements.

Traceability and Monitoring (T/M)

- The tasks concerned with managing requirements throughout the project and includes communicating requirements status to stakeholders. Much of this domain is described in the Planning domain with this domain focusing on the execution of those plans.

Solution Evaluation (SE)

- The tasks plus tools and techniques to evaluate the delivered solution will meet the requirements and the business need. This evaluation includes artifacts that contribute to the solution development and obtaining stakeholder signoff that the solution is ready for deployment

Soft Skills

- While not formally a domain, soft skills are an important part of the PMI-PBA examination as outlined by the knowledge and skills needed in the PMI-PBA Examination Content Outline.
